1. Summary 2
2. Metrics 3
3. Architecture 4
4. Next steps 5

ABSTRACT

This report is converted with a custom Typst template, `theme/theme.typ`: the cover page, the header and footer, the colors, the font (M PLUS Rounded 1c, whose files are in `theme/fonts`), the admonitions, the tables and the `badge` role come from the template. The `company` and `classification` attributes of this document are read by the template.

1. Summary

The quarter was marked by the first release of the new PDF converter, which runs on the JVM without Ruby and without any native library.[1]

TIP
Templates are plain Typst files: a template redefines the functions of the base template it wants to change, and keeps the others.

1.1. Highlights

- The converter supports most of the AsciiDoc elements.
- A conversion takes about **150 ms** once the JVM is warm.
- A template can read any document attribute.

> Finally, a PDF converter that I can style with a real language.
>
> — A happy user

[1] Typst runs as WebAssembly, translated to JVM bytecode by Chicory.

2. Metrics

Table 1. Key metrics of the quarter

Metric	Q2	Q3	Trend
Documents converted	1,204	3,890	▲
Average conversion time (ms)	410	152	▼
Templates in use	2	9	▲
Open issues	37	21	▼

WARNING
The figures of Q2 were measured with an earlier version of the converter.

Example 1. Where the time goes
Most of the conversion time is spent in Typst on the first conversion: the JVM loads and compiles the classes translated from WebAssembly. The next conversions reuse the compiler and its incremental cache.

3. Architecture

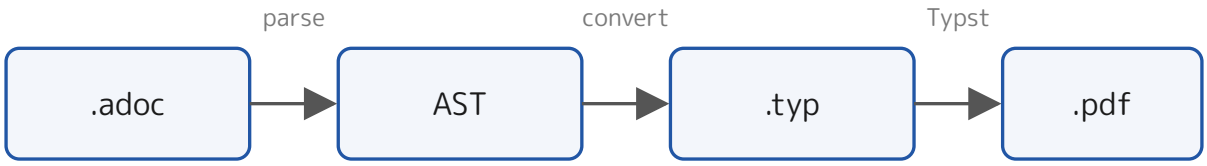

Figure 1. The conversion pipeline

The template receives the document metadata and the document attributes:

```
#let asciidoctor(title: none, authors: (), attributes: (:), ..args, body) = {
  let company = attributes.at("company", default: none)
  set page(header: [#company #h(1fr) #title])
  body
}
```

Technical debt

The STEM notations (latexmath, asciimath) are displayed as source code: Typst has no TeX parser. Remote images are not supported yet.

4. Next steps

1. Publish AsciidoctorJ 4 and the Typst module to Maven Central.
2. Provide a gallery of templates.
3. Support remote images.

IMPORTANT
The next report is due on 2027-01-15.

CAUTION
This document is internal: don’t share it outside of the company.
